

# Keys

- In the relational model, keys are important because they are used to ensure that **each row in a table is uniquely identifiable**.
- Consists of **one or more attributes that determine other attributes**.
- **Primary key (PK)** is an attribute (or a combination of attributes) that uniquely identifies any given entity (row)
- Key's role is based on **determination**
- If you know the value of attribute A, you can look up (determine) the value of attribute B
- **STU\_NUM  $\rightarrow$  STU\_LNAME**
- **STU\_NUM  $\rightarrow$  STU\_LNAME, STU\_FNAME, STU\_INIT**
- **STU\_NUM  $\rightarrow$  STU\_LNAME, STU\_FNAME, STU\_INIT, STU\_DOB, STU\_TRANSFER**

# Example Tables

Database name: Ch03\_TinyCollege

Table name: STUDENT

|   | STU_NUM | STU_LNAME | STU_FNAME | STU_INIT | STU_DOB     | STU_HRS | STU_CLASS |
|---|---------|-----------|-----------|----------|-------------|---------|-----------|

 STU\_CLASS = Student classification  
 STU\_DOB = Student date of birth

STU\_GPA = Grade point average  
 STU\_PHONE = 4-digit campus phone extension  
 PROF\_NUM = Number of the professor  
 who is the student's advisor

# Keys (Cont'd)

## Superkey

- Any key that uniquely identifies each entity
- In the STUDENT table, the superkey could be any of the following:
  - STU\_NUM
  - STU\_NUM, STU\_LNAME
  - STU\_NUM, STU\_LNAME, STU\_INIT
- In fact, STU\_NUM, with or without additional attributes, can be a superkey even when the additional attributes are redundant.

# Example Tables

 PROF\_NUM = Number of the professor  
 who is the student's advisor

# Keys (Cont'd)

- **Candidate key**

- A superkey without redundancies 
- A candidate key can be described as a minimal superkey.
- STU\_SSN and STU\_NUM

- STU\_LNAME, STU\_FNAME, STU\_INIT, STU\_PHONE
- might also be a candidate key, as long as you discount the possibility that two students share the same last name, first name, initial, and phone number.

- **Composite key**

- Composed of more than one attribute

- STU\_LNAME, STU\_FNAME, STU\_INIT, STU\_PHONE  $\rightarrow$  STU\_HRS, STU\_CLASS

or

- STU\_LNAME, STU\_FNAME, STU\_INIT, STU\_PHONE  $\rightarrow$  STU\_HRS, STU\_CLASS, STU\_GPA

or

- STU\_LNAME, STU\_FNAME, STU\_INIT, STU\_PHONE  $\rightarrow$  STU\_HRS, STU\_CLASS, STU\_GPA, STU\_DOB

# Functional dependence

- The term functional dependence can be defined most easily this way: the attribute B is functionally dependent on A if A determines B.

More precisely:

- **The attribute B is functionally dependent on the attribute A if each value in column A determines *one and only one value in column B.***

# Functional dependence

- STU\_PHONE is functionally dependent on STU\_NUM.
  - For example, the STU\_NUM value 321452 determines the STU\_PHONE value 2134. On
- the other hand, STU\_NUM is not functionally dependent on STU\_PHONE
  - because the STU\_PHONE value 2267 is associated with two STU\_NUM values: 324274 and 324291.(dormitory situation)

# Full Functional Dependence

- The notion of functional dependence can be further refined by specifying full functional dependence:

**If the attribute (B) is functionally dependent on a composite key (A) but not on any subset of that composite key, the attribute (B) is fully functionally dependent on (A).**

# Full Functional Dependence

- STU\_LNAME, STU\_FNAME, STU\_INIT, STU\_PHONE  $\rightarrow$  STU\_HRS, STU\_CLASS

or

- STU\_LNAME, STU\_FNAME, STU\_INIT, STU\_PHONE  $\rightarrow$  STU\_HRS, STU\_CLASS, STU\_GPA

or

- STU\_LNAME, STU\_FNAME, STU\_INIT, STU\_PHONE  $\rightarrow$  STU\_HRS, STU\_CLASS, STU\_GPA, STU\_DOB

## Entity Integrity and Null value:

- Within a table, each primary key value must be unique to ensure that each row is uniquely identified by the primary key. In that case, the table is said to exhibit entity integrity. To maintain entity integrity, a null (that is, no data entry at all) is not permitted in the primary key.
- A null is no value at all. It does not mean a zero or a space. A null is created when you press the Enter key or the Tab key to move to the next entry without making a prior entry of any kind. Pressing the Spacebar creates a blank (or a space).
  - There are rare cases in which nulls cannot be reasonably avoided when you are working with nonkey attributes. For example, one of an EMPLOYEE table's attributes is likely to be the EMP\_INITIAL. However, some employees do not have a middle initial. Therefore, some of the EMP\_INITIAL values may be null.

# Null value

- In any case, even if nulls cannot always be avoided, they must be used sparingly. In fact, the existence of nulls in a table is often an indication of poor database design.
- Nulls, if used improperly, can create problems because they have many different meanings. For example, a null can represent:
  - An unknown attribute value.
  - A known, but missing, attribute value.
  - A “not applicable” condition.

# Controlled Redundancy

- Makes the relational database work
- Tables within the database share common attributes that enable us to link tables together
- Multiple occurrences of values in a table are not redundant when they are *required* to make the relationship work
- Redundancy is *unnecessary* duplication of data

- For example, note that the PRODUCT and VENDOR tables in Figure share a common attribute named VEND\_CODE. And note that the PRODUCT table's VEND\_CODE value 232 occurs more than once, as does the VEND\_CODE value 235. Because the PRODUCT table is related to the VENDOR table through these VEND\_CODE values, the multiple occurrence of the values is required to make the 1:M relationship between VENDOR and PRODUCT work.
- Each VEND\_CODE value in the VENDOR table is unique—the VENDOR is the “1” side in the VENDOR-PRODUCT relationship. But any given VEND\_CODE value from the VENDOR table may occur more than once in the PRODUCT table, thus providing evidence that PRODUCT is the “M” side of the VENDOR-PRODUCT relationship

Table name: **PRODUCT**

| 235       | Henry Ortozo       | 615           | 899-3425   |

# Relational Schema

- A relational schema is a textual representation of the database tables where each table is listed by its name followed by the list of its attributes in parentheses.
- For Examples:  
VENDOR (VEND\_CODE, VEND\_CONTACT, VEND\_AREACODE, VEND\_PHONE)  
PRODUCT (PROD\_CODE, PROD\_DESCRIPT, PROD\_PRICE, PROD\_ON\_HAND, VEND\_CODE)

## Represented By The Relational Diagram

# Foreign Key (FK) and Referential Integrity

- A foreign key (FK) is an attribute whose values match the primary key values in the related table. For example, in Figure, the VEND\_CODE is the primary key in the VENDOR table, and it occurs as a foreign key in the PRODUCT table. Because the VENDOR table is not linked to a third table, the VENDOR table shown in Figure, does not contain a foreign key.
- If the foreign key contains either matching values or nulls, the table that makes use of that foreign key is said to exhibit referential integrity. In other words, referential integrity means that if the foreign key contains a value, that value refers to an existing valid tuple (row) in another relation. Note that referential integrity is maintained between the PRODUCT and VENDOR tables shown in Figure

Table name: PRODUCT

Primary key: PROD\_CODE

Foreign key: VEND\_CODE

Database name: Ch03\_SaleCo

| PROD_CODE | PROD_DESCRIPT                   | PROD_PRICE | PROD_ON_HAND | VEND_CODE |
|-----------|---------------------------------|------------|--------------|-----------|
| 001278-AB | Claw hammer                     | 12.95      | 23           | 232       |
| 123-21UUY | Houselite chain saw, 16-in. bar | 189.99     | 4            | 235       |
| QER-34256 | Sledge hammer, 16-lb. head      | 18.63      | 6            | 231       |

# Integrity Rules

| ENTITY INTEGRITY      | DESCRIPTION   |
|-----------------------|---|
| Requirement           | All primary key entries are unique, and no part of a primary key may be null.   |
| Purpose               | Each row will have a unique identity, and foreign key values can properly reference primary key values.   |
| Example               | No invoice can have a duplicate number, nor can it be null. In short, all invoices are uniquely identified by their invoice number.   |
| REFERENTIAL INTEGRITY | DESCRIPTION   |
| Requirement           | A foreign key may have either a null entry—as long as it is not a part of its table's primary key—or an entry that matches the primary key value in a table to which it is related. (Every non-null foreign key value <i>must</i> reference an <i>existing</i> primary key value.)                      |
| Purpose               | It is possible for an attribute NOT to have a corresponding value, but it will be impossible to have an invalid entry. The enforcement of the referential integrity rule makes it impossible to delete a row in one table whose primary key has mandatory matching foreign key values in another table. |
| Example               | A customer might not yet have an assigned sales representative (number), but it will be impossible to have an invalid sales representative (number).  |

# Integrity Rules (cont'd)

Table name: CUSTOMER

Database name: Ch03\_InsureCo

Primary key: CUS\_CODE

Foreign key: AGENT\_CODE

|   | CUS_CODE | CUS_LNAME | CUS_FNAME | CUS_INITIAL | CUS_AREACODE | CUS_PHONE | CUS_RENEW_DATE | AGENT_CODE |
|---|----------|-----------|-----------|-------------|--------------|-----------|----------------|------------|
| ► | 10010    | Ramas     | Alfred    | A           | 615          | 844-2573  | 12-Mar-06      | 502        |
|   | 10011    | Dunne     | Leona     | K           | 713          | 894-1238  | 23-May-06      | 501        |
|   | 10012    | Smith     | Kathy     | W           | 615          | 894-2285  | 05-Jan-06      | 502        |
|   | 10013    | Olowski   | Paul      | F           | 615          | 894-2180  | 20-Sep-06      |            |
|   | 10014    | Orlando   | Myron     |             | 615          | 222-1672  | 04-Dec-06      | 501        |
|   | 10015    | O'Brian   | Amy       | B           | 713          | 442-3381  | 29-Aug-06      | 503        |
|   | 10016    | Brown     | James     | G           | 615          | 297-1228  | 01-Mar-06      | 502        |
|   | 10017    | Williams  | George    |             | 615          | 290-2556  | 23-Jun-06      | 503        |
|   | 10018    | Farriss   | Anne      | G           | 713          | 382-7185  | 09-Nov-06      | 501        |
|   | 10019    | Smith     | Olette    | K           | 615          | 297-3809  | 18-Feb-06      | 503        |

Table name: AGENT

Primary key: AGENT\_CODE

Foreign key: none

|   | AGENT_CODE | AGENT_AREACODE | AGENT_PHONE | AGENT_LNAME | AGENT_YTD_SLS  |
|---|------------|----------------|-------------|-------------|----------------|
| ► | 501        | 713            | 228-1249    | Alby        | \$1,735,453.75 |
|   | 502        | 615            | 882-1244    | Hahn        | \$4,967,003.28 |
|   | 503        | 615            | 123-5589    | Okon        | \$3,093,980.41 |

# Entity integrity & Referential integrity

- **Entity integrity.** The CUSTOMER table's primary key is CUS\_CODE. The CUSTOMER primary key column has no null entries, and all entries are unique. Similarly, the AGENT table's primary key is AGENT\_CODE, and this primary key column also is free of null entries.
- **Referential integrity.** The CUSTOMER table contains a foreign key AGENT\_CODE, which links entries in the CUSTOMER table to the AGENT table. The CUS\_CODE row that is identified by the (primary key) number 10013 contains a null entry in its AGENT\_CODE foreign key because Mr. Paul F. Olowski does not yet have a sales representative assigned to him. The remaining AGENT\_CODE entries in the CUSTOMER table all match the AGENT\_CODE entries in the AGENT table.

# Relational Database Keys

| KEY TYPE      | DEFINITION   |
|---------------|--|
| Superkey      | An attribute (or combination of attributes) that uniquely identifies each row in a table.  |
| Candidate key | A minimal (irreducible) superkey. A superkey that does not contain a subset of attributes that is itself a superkey.                 |
| Primary key   | A candidate key selected to uniquely identify all other attribute values in any given row.<br>Cannot contain null entries.           |
| Secondary key | An attribute (or combination of attributes) used strictly for data retrieval purposes.   |
| Foreign key   | An attribute (or combination of attributes) in one table whose values must either match the primary key in another table or be null. |

# Flags

- To avoid nulls, some designers use special codes, known as flags, to indicate the absence of some value.
- The code -99 could be used as the AGENT\_CODE entry of the fourth row of the CUSTOMER table to indicate that customer Paul Olowski does not yet have an agent assigned to him.

TABLE  
3.5

A Dummy Variable Value Used as a Flag

| AGENT_CODE | AGENT_AREACODE | AGENT_PHONE | AGENT_LNAME | AGENT_YTD_SALES |
|------------|----------------|-------------|-------------|-----------------|
| -99        | 000            | 000-0000    | None        | \$0.00          |

# Other Integrity Rules

- Other integrity rules that can be enforced in the relational model are the *NOT NULL* and *UNIQUE* constraints.
- **NOT NULL** constraint can be placed on a column to ensure that every row in the table has a value for that column.
- The **UNIQUE** constraint is a restriction placed on a column to ensure that no duplicate values exist for that column.
